## Antibiotics

### Gram Positive

### Gram Negative

Class	Subclass	Antibiotic	Cocci							Rod (bacilli)				Anaerobes (except C. Diff)	Atypical pneumonias			
			Enterococcus	MRSA	Staphylococcus aureus (MSSA)	Streptococcus	Neisseria meningitidis	Haemophilus	E. Coli and coliforms	B-lactamase resistance*	Pseudomonas							
<b>Target cell wall</b>	<b>β-lactams</b> β-lactam ring lodges in bacterial cell wall	Flucloxacillin <i>Large so not affected by β-lactamase</i>		<i>MRSA is resistant to β-lactams due to modification of penicillin binding protein</i>	++++	+												
		Benzylpenicillin	++ <i>Not all</i>		<i>Staph secretes penicillinase (β-lactamase that destroys β-lactam ring of penicillin)</i>	++++	++					-Penicillinase -ESBL -Amp C -Carbapenemase		+				
		Amoxicillin/ Ampicillin				+++			+	+	Many resistant							
		Co-Amoxiclav (Amoxicillin + β-lactamase inhibitor)	<i>+++</i>			<i>Cefuroxime doesn't penetrate BBB</i>			++			-Amp C (resistant to inhibitor) -Carbapenemase						
		Tazocin (Piperacillin + β-lactamase inhibitor)							<i>+++</i>			ESBLs sensitive in vitro but have variable activity in vivo	+++	++				
		Carbapenems										-Carbapenemase	+++					
		Meropenem										Antibiotic of choice for ESBL/Amp C						
	2 <sup>nd</sup> gen Cephalosporins	Cefuroxime	<i>++</i>									-ESBL (but sensitive to cephamycins) -Amp C -Carbapenemase						
	3 <sup>rd</sup> gen Cephalosporins	Ceftriaxone/ Cefotaxime										Ceftazidime is used for pseudomonas only (best agent)						
	4 <sup>th</sup> gen Cephalosporins	Cefepime										-ESBL (variable) -Carbapenemase (variable)	+++					
<b>Target protein synthesis</b>	Glycopeptides <i>Inhibit peptidoglycan links in cell wall</i>	Vancomycin/ Teicoplanin	+++ <i>Some strains resistant (VRE)</i>	+++		++								+				
	Aminoglycosides <i>Inhibit 30S ribosomal subunit</i>	Gentamicin	+	+	<i>++</i>					+++	Some cross resistance with ESBL and carbapenemase	+++	Aminoglycosides use oxygen dependent active transport					
	Tetracyclines <i>Inhibit 30S ribosomal subunit</i>	Doxycycline		++						+/-				++				
	Lincosamides <i>Inhibit 50S ribosomal subunit</i>	Clindamycin		++						++			++					
	Macrolides <i>Inhibit 50S ribosomal subunit</i>	Erythromycin/ Clarithromycin/ Azithromycin (gram -ve)			<i>++</i>					++				+++				
	Misc <i>Inhibit 50S ribosomal subunit</i>	Chloramphenicol	++	+		+	+	+	+	+/-			++					
	Fluroquinolones <i>Inhibit DNA gyrase</i>	Ciprofloxacin		+						+++	+++	Some cross resistance with ESBL and carbapenemase	++		+++			
	<b>Misc <i>Inhibit DNA</i></b>	Metronidazole											+++					
		Trimethoprim			+					+	++							
		Co-trimoxazole (sulfamethoxazole + trimethoprim)							++	++	Some cross resistance with ESBL and carbapenemase							
		Nitrofurantion	++							++								

**Atypical pneumonias:** legionella (gram -ve), mycoplasma

**Anaerobes:** clostridium (gram +ve rod), bacteroides (gram -ve rod)

\***β-lactamase resistance:** β-lactamases are enzymes produced some bacteria which break down the β-lactam ring of certain β-lactam antibiotics and cause resistance.

Penicillinase is produced by several bacteria, most notably staphylococcus; the other β-lactamases (ESBL, Amp C, carbapenemase) are mainly produced by some enterobacteriaceae.

**Coliforms (lactose-fermenting enterobacteriaceae):** E. coli, enterbacter, klebsiella

**Other important bacteria to know antibiotics for:** mycobacterium (gram +ve rod); clostridium difficile (gram +ve rod); chlamydia (gram -ve)

## Coverage Needed

### Community acquired pneumonia

- Streptococcus pneumoniae
- Haemophilus influenza (if not vaccinated)
- Atypicals

If immunocompromised (i.e. malnourished, alcoholic, diabetic, on long term steroids), also: staphylococcus aureus, coliforms, TB  
If severely immunosuppressed (i.e. HIV with CD4<200, transplant recipient): pneumocystis carinii, cryptococcus, CMV, varicella zoster virus, influenza, fungal infections

### Hospital acquired pneumonia

- Staphylococcus aureus (including MRSA)
- Anaerobes
- Coliforms
- Pseudomonas

### Colonising bacteria in chronic respiratory ill health (may or may not cause infection e.g. exacerbation)

- Streptococcus pneumoniae
- Haemophilus influenzae
- Moraxella catarrhalis
- Staphylococcus aureus
- Pseudomonas

In cystic fibrosis, also: burkholderia cepacia

### Upper respiratory tract infections

- Streptococcus pneumoniae
- Streptococcus pyogenes
- Haemophilus influenzae
- Moraxella catarrhalis

### Cavitating pneumonia

- Streptococcus pneumoniae
- Staphylococcus aureus
- Klebsiella
- TB
- Anaerobes

### Intra-abdominal (including biliary)

#### Normal bowel flora:

- Anaerobes e.g. bacteroides
- Coliforms
- Enterococcus

### Gastroenteritis/diarrhoea → ceftriaxone/ciprofloxacin/azithromycin

- Salmonella enteritidis
- Shigella
- Campylobacter
- E. coli (enterotoxic)

Less common: yersinia enterocolitica, bacillus cereus, staphylococcus aureus

If been at risk, also: clostridium difficile, vibrio cholerae, salmonella typhi

If dysentery: shigella, vibrio cholera, amoeba

Don't forget viral, parasitic and non-infectious causes!

### Skin/joints/bone

- Staphylococcus aureus
- Streptococcus pyogenes

For wound/ulcer infections or severe/necrotising cellulitis, also: anaerobes

For burns, also: anaerobes, pseudomonas

For post-surgical wounds, also: gram negative bacilli (e.g. E. coli, kelbsiella, pseudomonas), enterococci, MRSA, CONS

NB. wound colonising bacteria (colonise exudate without necessarily causing infection) include: coliforms, enterococcus, anaerobes

### Meningitis

- Nisseria meningitidis (meningococcal)
- Streptococcus pneumonia (pneumococcal)
- Haemophilus influenza (if not vaccinated)
- Listeria (if >65y or immunocompromised)

If neonatal: group B streptococcus, E. coli/coliforms, listeria (rare)

### Urine

1. E. coli
2. Staphylococcus saprophyticus
3. Non-E. Coli enterobacteriaceae (klebsiella, enterobacter, proteus), pseudomonas, enterococci, staphylococci (CONS/aureus)

Less common organisms (3) are associated with: catheters, hospital, structural abnormalities and instrumentation

### Infective endocarditis

- Viridans group streptococci and other streptococci (e.g. bovis)
- Enterococci
- Staphylococcus aureus and coagulase negative staphylococci (e.g. epidermidis)
- Coxiella burnetii
- HACEK organisms

### Surgical prophylaxis

- Need to cover skin ± intra-abdominal

### Sepsis of unknown origin

- Need to cover skin, chest, urine, meningitis, intra-abdominal
