INSTRUCTIONS
ATTEMPT ALL QUESTIONS
ANSWER EACH QUESTION ON A SEPARATE SHEET OF PAPER

- Discuss hypoglycemia under the following headings:-
 - Causes (4 marks) *Insulinoma, Adrenal insufficiency*
 - Clinical features (2 marks) *Blurred vision, sweating*
 - Biochemical investigations (4 marks) *FBS, RBS*

A 60 year old male presents to A&E with history of acute onset of constrictive chest pain associated with dyspnoea and profuse sweating.

*Non Myoglobin
Albumin
Bilirubin
Creatinine*

- List 2 possible differential diagnosis (2 marks) *MI / Angina*
- List the investigations that can be done at the A & E. (2 marks) *ECG*
- Describe the diagnostic biochemical tests. (6 marks)

- Classify hyperlipidaemias. (10 marks)
- Distinguish between internal and external quality control programs. (10 marks)

hypercholesterolemia

hypercholesterolemia

dysbetalipoproteinemia

TC

- insulin excess ✓
 - stress/anxiety
 - medications - ✓ metformin
 - Excessive alcohol consumption ✓
 - chronic illness - hepatic, kidney ✓
 - endocrine
 - Hormone def
 - fx
 - neuroglycopenic - headache, dizziness, vision
 - cerebral perfusion - syncope, coma
 - Autonomic -
- RBS, FBS
 - ✓ OGTT
 - ✓ Blood culture.
 - ✓ Urinalysis

U&E - must know reference range.

HAEMATOLOGY

CASE HISTORY 1

A 42 year old woman presents with a history of increasing lethargy, dizziness and breathlessness. She had brittle hair and nails. She complained of heart palpitation on exercise and reported particularly heavy periods. Biochemical investigations revealed the following:-

Serum iron	-	4umol/l	N = 4-20 μ mol/L 4-20 μmol/L
Transferin saturation	-	10%	W = 33%
Ferritin	-	<5ug/L	30 μ g/L

What is the diagnosis and what other investigations should have been done first? PBI
↳ IDA

CASE HISTORY 2

A 12 year old Asian girl presented with nausea and vomiting and non localizing neurological signs.

She has been using brightly coloured facial cosmetics obtained locally.

Diagnosis:-

- What biochemical investigations would be appropriate? ✓ Heavy metal poisoning CI

MULTIPLE ORGAN DISORDER (LIPID PROFILE)

CASE HISTORY 3

A 53 year old male was found to have the following results on a fasting sample:-

Total cholesterol	-	8.4mmol/L	6.7 ↑
Triglycerides	-	6.8mmol/L	2.3 ↑
Glucose	-	9.8mmol/L	6.1
Gamma GT	-	138u/L	50-90

A non smoker, his blood pressure was 145/95mmHg and he was obese with central fat distribution.

Diagnosis:

- What other information and investigations would be helpful in this man's management?
- What treatment options would you consider in this case.

INSTRUCTIONS

ATTEMPT ALL QUESTIONS

ANSWER EACH QUESTION ON A SEPARATE SHEET OF PAPER

1. A 60 year old female who is a known diabetic presented to casualty and a lipid profile was requested. Results were as follows:

- Lipids
- Total cholesterol - 11.0 mmol/L (<6.7)
 - Triglycerides - 8.1 mmol/L (<1.7)
 - HDL cholesterol - 0.6 mmol/L (<1.03)
 - LDL cholesterol - 7.9 mmol/L (<5.2)

If TC > 4

ALDL
ATG
TC = A

$(\frac{TG}{2} + HDL-C)$

- Comment on the results. (2 marks) \uparrow chole \uparrow TG \uparrow LDL - hyperlipidaemia.
- How was the LDL-cholesterol determined? (2 marks) $TC - HDL - C$
- Outline the role of HDL-cholesterol in 'reverse cholesterol transport'. (3 marks) Collect cholesterol from cells & transport it to liver & thru bile & excreted thru faeces.
- What other biochemical tests would be relevant for this patient? (3 marks)

- glycated HbA1c
- RBS
- Cardiac markers
- RET & LFT
- ECG
- Urinalysis

Compensated metabolic acidosis

2. The following BGA results were obtained from a patient in ICU:

pH	7.26	- 7.35-7.45	\downarrow acidosis
HCO ₃ ⁻	13 mmol/L	22-28	\downarrow
PCO ₂	31 mmHg (35-45)		\downarrow
Na ⁺	136 mmol/L	135-145	N
K ⁺	4.8 mmol/L	3.5-5.0	N
Cl ⁻	105 mmol/L	98-106	N

met alkalosis
Acid Base map
see abnormality human body's main balance of acids & bases wet causes plasma pH to deviate out of normal range
Cardiac done

- What is the acid-base disturbance? (2 marks) compensated metabolic acidosis
- Calculate the anion gap and comment on the result (3 marks) $(136 + 4.8) - (13 + 105)$
- List the possible causes of the above acid-base disturbance (5 marks)

hyperchloraemic acidosis less than 11 norm
compensatory metabolic
Adrenal insufficiency
Sarcoidosis
hypoaldo
Intestinal fluid loss
Normal anion gap

A 60 year old male presents to A&E with history of acute onset of constrictive chest pain associated with dyspnoea and profuse sweating.

- List 2 possible differential diagnoses (2 marks) Cardiac arrest & MI
- List the investigations that can be done at the A & E. (2 marks) Cardiac markers
- Describe the confirmatory diagnostic biochemical tests. (6 marks)

Fluid & electrolytes done

An old female patient was found to have a plasma sodium level of 126.0 mmol/L. Discuss the possible causes of this finding (10 marks).

High gap MA - MUDPILES

When pulm edema - \downarrow CO₂ & \downarrow O₂

- Methanol Toxic
- Uraemia of RF
- DM
- Paralytic toxic
- Isoniazid
- Lactic acidosis
- Ethylene glycol toxic

10-BASE BALANCE V

What are the reference values for

- a) Arterial blood gases ^{pH} 7.35 - 7.45
- b) Venous blood gases

PCO_2 - 35-45 mmHg
 PO_2 - 7.80-100 mmHg
 HCO_3^- 22-28 mmol/L

Describe the main sources of acid in body indicating

- a) Whether it is volatile or non volatile
- b) Quantity produced

volatile
 Carbonic

Non-volatile
 PO_4
 SO₄

protein → carbonic
 - buffer - H₂O
 - renal reabsorption of HCO_3^-
 - resp

- 3. a) What are the mechanisms used by the body to stabilize blood pH?
- b) What is compensation? What are the compensatory limits?

Carbonic 24000 mmol

- 4. Describe how haemoglobin contributes to buffering
- 5. Describe the role of the kidney in acid-base balance
- 6. Which are the main buffers in urine? Which responds most rapidly to an acid load? Which urine buffer has greater capacity?

7. a) Describe

- i) Anion gap
- ii) Base excess

Difference between ^{PO₄, NH₃} commonly measured cations - Anions
 - more cations than anions
 range 8-18

- b. i) What are their reference ranges?
- ii) What is the value of measuring them?

- 8. What are the causes of pre-analytical errors in blood gas analysis (BGA's)
- 9. How is the Handerson-Hasselbalch's equation used in interpretation of BGA's
- 10. Classify clinical disorders of acid base balance(give examples)

$pH = pK_A + 1$

11. Case 1:

→ Mem. A 61 year old man was admitted with pulmonary oedema. Arterial blood gases were done.

PH - 7.10 ↓ acidotic
 PaCO₂ - 25mmHg ↓
 HCO₃ - 18 mmol/L ↓
 PaO₂ - 34mmHg ↓
 BE (ECF) - 29

- a) What is the acid-base disturbance? compensated metabolic acidosis. pH normal
- b) Explain the likely cause. lactic acidosis.
- c) Discuss other conditions which can give rise to this type of acid-base disorder.

12. Case 2. A 34 year old woman was brought to the accident and emergency room in coma. She was suspected of having taken a drug overdose. Arterial blood gas analysis revealed the following:

PH - 7.10 ↓ **acidosis**
 PCO2 - 80mmHg ↑
 PO2 - 42mmHg ↓
 HCO3 - 28mmol/L Normal
 SO2 - 65%

partially compensated

Resp acidosis

- a) What is the acid-base disturbance? *Respiratory acidosis*
 b) What drug(s) is she likely to have taken? *Narcotics/sedatives / Benzodiazepine + alcohol*
 c) Discuss other causes of this type of disturbance. *Neurolept analgesia, drugs, opioids, lung dx, chest deformities, COPD, Neuromuscular dx*

13. Case 3. A 49 year old man underwent intestinal resection for sigmoid colon perforation. Continuous gastric aspiration was applied post-operatively. Arterial blood gases analysis revealed the following:

pH - 7.44 Normal
 PaCO2 - 49 mmHg ↑
 HCO3 - 35 mmol/L ↑
 BE (ECF) - +8.5
 Na+ - 149 mmol/L (135 - 145) ↑
 K+ - 2.4 mmol/L (3.5 - 5.0) ↓
 CL- - 87 mmol/L (95 - 105) ↓

Metabolic acidosis/resp.

COPD + V

COPD + divert (omit)

$$\begin{array}{r} 149 + 35 \\ 149 \\ \hline 35 \\ \hline 184.0 \\ 99.4 \\ \hline 84.6 \end{array}$$
High gap MA

- a) What is the acid-base disturbance? *fully compensated mixed acidosis*
 b) Explain the likely cause. *lactic acidosis*
 c) Discuss other conditions which can give rise to this type of acid-base disorder. **AMBUPILES.**

14. Case 4. The following results were obtained from a 55 year old man with liver cirrhosis and gross ascites, who is on diuretic therapy.

PH - 7.60 ↑ **Mixed metabolic resp. alkalosis.**
 PCO - 3.1mmHg ↓
 HCO - 35mmol/L ↑
 BE (EFC) - 11.9
 Na+ - 129mmol/L ↓
 K+ - 3.0mmol/L ↓

hyperventilate
 hyperventilate stimulates resp center - hyperventilate

mixed respiratory metabolic alkalosis

hypokalemia in alkalosis body retains H+
 Paradoxical aciduria

- a) What is the acid-base disturbance?
 b) Discuss how it may have come about **paradoxical aciduria**
 c) Discuss other causes of this type of acid-base disturbance. **hypervent, hypokalemia.**

Diabetes Mellitus Tutorial Guide

1. What are the reference values for blood glucose? ✓
2. What is diabetes mellitus? ✓
3. What is the classification for diabetes mellitus? ✓
4. Define the following terms:
 - a) Impaired fasting glycaemia ✓
 - b) Impaired glucose tolerance
5. A 47 year old female presented to the outpatient with features suggestive of diabetes mellitus.
 - a) What is the metabolic basis for the typical signs and symptoms of diabetes? ✓
 - b) Describe the algorithm to be used to reach a diagnosis of diabetes in this patient. ✓
6. Screening for diabetes is recommended for at risk individuals in the general population? Who are at high risk? How should screening be done? OGTT, HbA1c, FBS.

FN
 7. A 24 year old pregnant woman attending an ante-natal clinic was found to have glycosuria. The random blood glucose was 6.9mmol/L. What is the diagnosis? What further tests should be done?
 ✓ Hypertension
 ✓ Coronary Artery
 ✓

7. A 24 year old pregnant woman attending an ante-natal clinic was found to have glycosuria. The random blood glucose was 6.9mmol/L. What is the diagnosis? What further tests should be done?
 3.1-7.8 ↓ gestational DM. FBS RFT & microalbumin
8. What is secondary diabetes? What conditions are associated with it? How are plasma insulin levels in secondary diabetes? Give reasons.

9. A 28 year old female, a known diabetic on treatment, was brought to casualty in semi-coma. Biochemical tests revealed the following:

Plasma:	-	Glucose	-	32.8mmol/L ↑	HOME
	-	Sodium	-	153mmol/L ↑	⇒ 3.2-7.8
	-	Potassium	-	6.4mmol/L ↑	
	-	Bicarbonate	-	14mmol/L ↓	Acidosis
	-	Urea	-	8.9mmol/L (N-2.6-4) ↑	

Metabolic acidosis

 Acidity

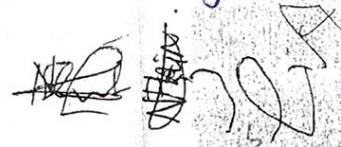

- a) What is the diagnosis? RFT, ketone bodies & BGA
- b) What are the confirmatory tests? - cause hypokalaemia
- c) What is the metabolic basis for this presentation? Gradual
- d) What is the effect of treatment on the electrolytes? Insulin & Potassium. In this case no K.

10. A 59 year old man with Type 2 diabetes for over 15 years, presented to casualty with confusion. Biochemical tests were as follows:

Plasma:	-	Glucose	-	64.3mmol/L ↑
	-	Sodium	-	178mmol/L ↑
	-	Potassium	-	5.4mmol/L (N)
	-	Bicarbonate	-	23mmol/L (N)
	-	Urea	-	23.6mmol/L ↑

MONK

- a) Calculate the plasma osmolality and comment on it. 2Na + Glucose + Urea
- b) What is the likely diagnosis? MONK. ↑ Na to show dehydration
- c) What are the expected urine findings? Glycosuria, ↑ SG, mild ketonuria, ↑ osmolality, urine evident
- d) What is the cause of this complication? ↑ Extreme dehydration
 ↑ hyperglycaemia

11. A diagnosis of diabetes mellitus was made in a 48 year old female who was admitted to hospital and she was discharged on oral hypoglycaemic treatment. What biochemical tests are recommended for treatment monitoring? Give reasons.
12. What are the long term monitors of glycaemic control? What are the recommendations on use of HbA1c? (frequency of analysis, type of sample, treatment goals). What are limitations of the HbA1c test?
13. What is microalbuminuria? What are the recommendations on microalbumin testing in type1 and type 2 diabetes? What are the causes of false positive microalbumin results?
14. Plasma lipid estimation was recommended in a type 2 diabetic patient.
 - a) What is the mechanism of dyslipidaemia in diabetes mellitus?
 - b) What are the common lipid derangements in diabetic patients?

HAEMATOLOGY

CASE HISTORY 1

A 42 year old woman presents with a history of increasing lethargy, dizziness and breathlessness. She had brittle hair and nails. She complained of heart palpitation on exercise and reported particularly heavy periods. Biochemical investigations revealed the following:-

Serum iron - 4umol/l
Transferrin saturation - 10% \rightarrow 33%
Ferritin - <5ug/L

What is the diagnosis and what other investigations should have been done first?

CASE HISTORY 2

A 12 year old Asian girl presented with nausea and vomiting and non localizing neurological signs. *side signs: Porphyria like syndrome, - Mostly acquired.*
She has been using brightly coloured facial cosmetics obtained locally.

Diagnosis:-

- What biochemical investigations would be appropriate?

Signs: Heavy metal poisoning - lead poisoning, lead inhibits ferrochelatase & PTP.

MULTIPLE ORGAN DISORDER (LIPID PROFILE)

CASE HISTORY 3

A 53 year old male was found to have the following results on a fasting sample:-

barbiturates, alcohol, x-ray of feet
Total cholesterol Δ - 8.4mmol/L \rightarrow (3.5-5.6) \checkmark PL (organic \rightarrow inorganic)
Triglycerides - 6.8mmol/L \rightarrow (0.3-1.5) \checkmark FFA
Glucose - 9.8mmol/L \rightarrow >6.1
Gamma GT (liver) - \uparrow indm. - AIP 138u/L \rightarrow (50-70)

hyperlipidaemia (ATC & TG) (Type IIb)

A non smoker, his blood pressure was 145/95mmHg and he was obese with central fat distribution. *apple shaped obesity*

HT + IR + Obesity - Metabolic syndrome (truncal)

Diagnosis:

hypoproteinaemia, hyperuricaemia

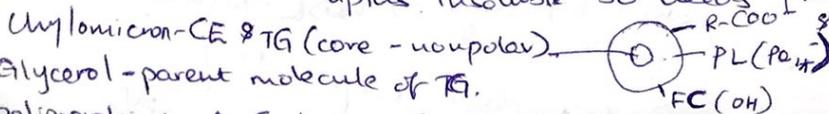

hyperlipidaemia \rightarrow to DM.

- What other information and investigations would be helpful in this man's management?
- What treatment options would you consider in this case. - Insulin, and HT, HMG-CoA reductase drugs.

48 hrs (GLC or high pressure liquid chromatography).

hyperlipidaemia (chole + TG \uparrow).

lipoproteins (LDL, HDL) - vessels to transport lipids from A \rightarrow B. lipids insoluble so needs protein transporters.

Apolipoproteins - A - E = has isoforms.

dyslipidaemia (ATC, TG, LDL \uparrow , HDL \downarrow)

DATE:
