SUE

UNIVERSITY OF NAIROBI

UNIVERSITY EXAMINATIONS 2017/2018

FINAL YEAR SUPPLEMENTARY/SPECIALS EXAMINATIONS FOR THE DEGREE OF BACHELOR OF MEDICINE AND BACHELOR OF SURGERY:

MCQ PAPER

CODE: HSU600

DATE: FEBRUARY 12, 2019

TIME: 9.00 A.M.-12.00P.M.

INSTRUCTIONS:

- 1. THERE ARE 100 MULTIPLE CHOICE QUESTIONS.
- 2. CHOOSE THE SINGLE BEST ANSWER
- 3. ANSWER IN THE ANSWER SHEET PROVIDED

Diect Hern 1. The following are true about inguinal triangle (of Hesselbach), EXCEPT: a) Is bounded laterally by the inferior epigastric artery b) Is bounded medially by the lateral border of rectus abdominis c) Is bounded inferiorly by the inguinal ligament Direct inguinal hernias occur lateral to inferior epigastric artery e) It is also known as the medial inguinal fossa 2. All of the following are findings of bladder exstrophy by screening ultrasound except: authopolic a an asak (a) Lower abdominal bulge Low It unfolicus (b) Low set umbilicus (c) Nonvisualization of the bladder widen public minu Hydronephrosis Deminitive general (e) Small penis Lower and mars as Pray pray MISTERUT Regarding patients with rigid abdomen and free air in plain film, which of the following statements is true? No further radiologic work up is required CT scanning with contrast enhancement is required to confirm the diagnosis c) Bedside sonographic imaging is preferred over CT imaging to confirm the diagnosis of the free air. Narcotic are contradicted in patients with an acute abdomen e) Preoperative prophylactic are indicated in patients with free air 4. Regarding rhabdomyolysis: Acute renal failure occurs secondary to the release of myoglobin. An alkalotic environment promotes the formation of myoglobin casts in the renal tubules, thereby worsening the kidney damage. The renal failure from rhabdomyolysis typically resolves within 3 to 5 days. d) Severe hyponatremia is a frequent complication. e) Alkalinization to a pH between 8 and 9 is an important treatment goal 5. Hypocalcemia is associated with a) Acidosis Alkalosis 1887 pringed b) Shortened QT interval Conduction 15 better with hyperital comia. Hypomagnesemia & Hyperphst. d) Myocardial irritability e) Hyperproteinemia high albumin I high calcim 6. Patient presents to casualty with an abdominal stab wound. Which of the following is not t a sign of shock in this patient? & graph to no itations A: neich mes a) Increased respiratory rate WITH IS ATTENTION THE VERROWITHTHE Toc Severe) (Tetany, Decreased pulse rate

C Falling blood pressure Richs sharm of skieletan winsche antiny Sprzinp Castalnound & 10% (3.d) Increased pulse rate rauses comps & retary. 10-20 OUT 88 10-15MIN. Viaingospasm with strictor ranobated e) Cold peripheries @ Monitor 102 4-dothe dirudy Choratek sign - Contand ion of Ca(A) 9-10.39/dU facial muscle in stapping to oral 1024 1-25 Hypomost (8.5mg/d) in Hormal phyma power [] the par Trousseau's sign; Carpal Etionogil: Hypopini, vito der; Renai Tubular do: Renai-fallul spasm occusion after occumon Mga Deportion, haute principentitis, typoposotenemia, of bracuical arteni with sp. Enhanced bone formation with imadeq artantike cutt for scritiniseptic shock; Hyperpust; bruss; Expessive selective of calcitonin Princed QT interval.

7. The following are complications of massive transfusion except a) Coagulopathy Porton Ha b) Hypocalcaemia Color Ha c) Hyperkalaemia d) Hypothermia Hypercalcaemia
8. Which of the following descriptions of ulcer edges denotes malignancy? a) Sloping — heating ulcer b) Overhanging Everted — Squamos real cancinoma d) Punched-out — Tophic ulcer b) Outled — Rasel cell cancinoma 9. The following investigations are appropriate prior to surgery in a 30yr old male patient except a) Full haemogram
b) INR c) U/E/C 12 lead ECG e) Group and crossmatch 10. A patient presents with weight loss, heat intolerance, proptosis and a neck mass. Which of the following investigations would you not order? a) Full blood count
b) Thyroid Function Test (TFT) c) Neck ultrasound Parathyroid Hormone levels e) Anti-thyroid Receptor Antibodies 11. Which of the following is not true in relation to strangulated hernias?
a) The present with local and generalised abdominal pain and vomiting 7. b) A normal hernia can strangulate at any time c) This is more common in femoral hernia They can be reliably excluded in irreducible hernias on clinical examination e) They require urgent surgery Which of the following is not a right factor for breast cancer?
 2. Which of the following is not a risk factor for breast cancer? a) Early menarche b) Family history c) Hormone replacement therapy d) Nulliparity e) Obesity

13. In patients receiving massive blood transfusion for acute blood loss, which of the Packed red blood cells and crystalloid solution should be infused to restore oxygenfollowing is correct? carrying capacity and intravascular volume. b) Two units of FFP should be given with every 5 units of packed red blood cells in most cases. Six packs of platelet concentrate should be administered with every 10 c) One to two ampules of 8.4% sodium bicarbonate should be administered with every 5 units of packed red blood cells to avoid acidosis. d) One ampule of calcium chloride should be administered with every 5 units of packed red blood cells to avoid hypocalcemia e) Whole blood and crystalloid solution should be infused to restore oxygen-carrying capacity and intravascular volume 14. Which one of the following statements is INCORRECT regarding surgical emphysema of the chest? It is a surgical emergency Tt is iatrogenic after thoracic surgical procedures c) It is a common complication in patients with chronic obstructive pulmonary disease (COPD) d) A perforated oesophagus is a well-known cause of surgical emphysema e) On a Chest radiograph it is noted as radiolucent areas within the subcutaneous tissué 15. A 49 year old man otherwise healthy man presented to the surgical clinic with complaints of a lump in his abdomen. On examination he was found to have a vertical midline mass measuring 5cm by 6cm with a cough impulse and was more prominent as he sat up from the recumbent position. His abdomen is otherwise soft and non-tender and he has no midline scars. What do you think this patient has? a) Incisonal hernia b) Epigastric hernia - < 1cm, No cough impulse Reduced c) Inguinal hernia Divarification of the rectus e) All of the above 16. Which one of the following statements is INCORRECT regarding a merkel diverticulum a) It is present in about 2% of the population Rule of Two I a feet - 60 cm 4m Illico It is about two metres from the ileocecal junction 2) It may contain heterotopic pancreatic and gastric tissue 29. | 2 ft from remarks symptomather and It is about two inches long 2 and the last the last long | But age of 2 to 1 e) It is a true diverticulum 2 all 3 layers of band wall -2 Finas of persone from no communication In the - 29, Emptoralis | MILF 2:1 17. A 56 year old man had an abdominoperineal resection for rectal cancer. He has a stoma in the left iliac fossa that has no pout and is flush to the skin. What kind of stoma does this patient have? a) Loop colostomy b) Mucous fistula Hash, tocal matter: End colostomy d) Ileostomy - spout; Liquid. e) Double barrel colostomy Page 4 of 18

18. Which one of the following statements is FALSE in regard to hernias?

a) Inguinal hernia lie superomedial to the pubic tubercle

b) Femoral hernias le inferolateral to the pubic tubercle

Men are most likely to have femoral hernias than women

d) The most common hernia in women are inguinal hernias

e) Men are more likely to get inguinal hernias than women

19. Jose is a 62 year man who has just been diagnosed with pancreatic cancer. You run into his brother in the corridor and he asks you not to tell Jose because the knowledge will kill him faster. A family conference to discuss the prognosis is scheduled for that's same afternoon. What is the best way for you as the doctor to handle the situation?

a) Honour the request of the family member who is protecting his brother from the bad

Tell his brother that withholding information is not permitted under any circumstance

c) Tell his brother to withhold the information as he wishes

d) Give the brother a dress down for suggesting such an option

Ask Jose how he would wish to handle the information infront of the rest of the family and allow the family some time to discuss the matter

20. A 49 year old man is found to have a solitary neck nodule on physical examination. NEH ROUT HYROPAS Aboratory studies reveal in elevated calcitopin level and fine needle aspiration confirms a diagnosis of medullary carcinoma of the thyroid. Which of the following disease

Hunty Admonstrapperparathyroidism /

Temor processes might the physician be concerned to look for in this patient?

The Admond Hyperparathyroidism

The Admond Hyperpara MEHZA) MEGILLIAN

Can Hyperthe) Pituitary adenoma PLUSCIED.

PLACELYCORE Zollinger-Ellison syndrome

Notation 21. A 28 year old man presents to casualty with testicular torsion and in extreme pain. He is scheduled for emergency surgery and the consultant urologist tells you he is on his way and will be there in the next one hour. He asks you not to give any pain medication so that "consent can be obtained" on his arrival. Are the surgeons concerns about informed consent valid?

ca U Melcosil

Chillia

Medullary

a) Yes. To obtain informed consent the patient must be lucid and pain medication can invalidate the consent

b) Yes. Because hospital policy requires informed consent from a lucid person before

c) It's an emergency you do not need informed consent in this case

Because of severe pain, the surgeon's concerns are not valid as it can impair a patient's ability to listen and understand in the informed consent process

e) None of the above

22. Which one of the following is not associated with compartment syndrome? Disproportionate level of pain b) Paralysis c) Absent distal pulses Paraesthesia et Calor Hod Duox-Pain Rubos-Ren) 23. Which one of the following statements is INCORRECT regarding chronic osteomyelitis? -selerosis rodinan, An cinum Point monty a) X-ray features may include sunrise calcification b) Brodies abscess is a subacute complication of chronic osteomyelitis c) Marjolins ulcer may be a long term complication in this disease d) Treatment include surgical debridement and long course IV antibiotics e) Staphyloccoccus aureus is the most common pathogen isolated in acute and chronic osteomyelitis 24. Which is the common causative organism of chronic osteomyelitis in children with a) Staphylococcus aureus b) Salmonella c) Group A Streptococcus d) Group B Streptococcus e) Shigella: 25. Which of the following statements about necrotising soft-tissue infections are true? They are usually polymicrobial infections. b) The onset is usually gradual and they run a chronic course. c) 'Dishwater pus' is a non-characteristic feature. d) Clostridial species cause toxic shock syndrome. e) Treatment is essentially medical using antibiotics 26. All of the following are problems associated with surgery in the jaundiced patient a) Clotting disorders b) Hepatorenal syndrome c) Infection d) Poor wound healing Myocardial infarction 27. Adequate minimum urine output during resuscitation is 0.5-1 ml/kg/hr b) 20 ml/kg/hr c) 50 ml/kg/hr d) 45 ml/hr e) 60 ml/hr

Which of the following is the symptom least specific for bladder outlet obstruction? b) Intermittency Nocturia d) Terminal dribbling e) Reduced urinary stream In skin preparation prior to operation, which of the following statements are true? a) In preparing open wounds, aqueous solutions are used. b) For intact skin, alcohol-based solutions may be used. c) Prepare the skin from the incision site outwards. d) Heavily contaminated areas are prepared last, with the swab being discarded. All of the above. Which of the following statements about scrotal and testicular problems is true? a) Torsion of the testis is seen most commonly between the ages of 20-30 years 12-13 b) Hydrocele is diagnosed by transillumination and if any portion transilluminates 15-18 (PROKOGE malignancy is excluded oto Marce (c) A right sided varicocele is slightly less common than a left sided ne A painless testicular mass in a man ages 20-35 years found incidentally is the most common presentation of a testicular tumour e) Epididymal cysts always occur in the tail of the epididymis encil 31 Which one of the following cases is considered a clean-contaminated wound? a) Open cholecystectomy for cholelithiasis b) Herniorrhaphy with mesh repair c) Lumpectomy with axillary node dissection d) Appendectomy with walled-off abscess _contant hot co e) Gunshot wound to the abdomen with injuries to the small bowel and sigmoid colon 32 Which of the following statements is true about testicular torsion? a) Swelling of the scrotum with fever b) A painless testicular mass that cannot be transilluminated c) A bag of worms appearance of the scrotum Sudden pain in the scrotum with an absent cremasteric reflex e) All of the above 33 Following an acute spinal cord injury a patient develops systematic hypotension and relative bradycardia. His bulbocavernosus reflex is present. This is a characteristic of what type of response in acute spinal cord injuries? a) Spinal shock b) Cardiac shock Neurogenic shock Hypovolemic shock

- 34 A 30-year-old male is involved in a motor cycle accident and sustains a fracturedislocation of the cervical spine. On physical exam he has absent distal motor function, absent sensation, absent rectal tone, and an intact bulbocavernosus reflex. Which term best describes this spinal cord injury pattern? a) Incomplete spinal cord injury
 - b) Complete spinal cord injury
 - c) Neurogenic shock
 - d) Spinal shock
- 35 All of the following are attributed to the loss of supraspinal control of the sympathetic nervous system that commonly occurs in patients with spinal cord lesions at T-6 or higher EXCEPT?
 - a) Orthostatic hypotension
 - b) Spasticity
 - c) Autonomic dysreflexia
 - d) Cardiac arrhythmias
- A 49-year-old male fell from a height of 10 feet while cleaning his roof. He sustained a fracture dislocation of T6/T7. Upon transfer from the outside hospital 10 hours later, he has 0/5 motor strength in bilateral lower extremities, no sensation distal to umbilious, and an intact bulbocavernosus reflex. He has no perianal sensation or rectal tone. He received no medical management at the outside hospital. Which of the following is the most appropriate use of methylprednisolone in this patient?
 - a) Initiate high-dose methylprednisolone with a loading dose of 30mg/kg and a drip of 5.4mg/kg/hrtor/Ctd
 - b) Initiate high-dose methylprednisolone, without a loading dose, at 5.4mg/kg/hr Do not initiate treatment with methylprednisolone.
 - d) Administer a one-time dose of methylprednisolone at a dose of 30mg/kg
- A 35-year-old male is involved in a motor vehicle accident and sustains a neck injury. The patient's physical exam is consistent with a Brown-Sequard spinal cord injury. Which of the following likely represents the motor and sensory findings?
 - a) Bilateral upper extremity loss of motor function and unilateral lower extremity loss of pain and temperature sensation
 - b) Bilateral loss of motor function and unilateral loss of pain and temperature sensation Ipsilateral loss of motor function and contralateral loss of pain and temperature
 - d) Ipsilateral loss of pain and temperature sensation and contralateral loss of motor function
- Which of the following are 'red flags' for possible serious spinal pathology?
 - a) Age over 55
 - b) Systematic steroid therapy
 - e) Difficulty with micturition
 - d) Cough-impulse pain

- thighs and numbness radiating into the feet with ambulation. It worsens with standing and walking and improves with sitting and bending forward. She has no bowel or bladder complaints. On examination, she has full strength, symmetric, and she has 2+ peripheral pulses. Straight leg raise is negative. What is the patient's most likely diagnosis?
 - a) Cauda equina syndrome
 - b) Herniated disc.
 - Spinal stenosis
 - d) Vascular claudication
- 40 A 55-year-old woman presents with a 9-month history of moderate low back pain constant in nature and not relieved with rest. The pain has awoken her from sleep on occasion. She has not had fever, chills, or night sweats; however, she has lost 15lb over the past 3 months. Her inedical history is significant for hypertension and breast cancer treated surgically. What is the next step in this patient's management?
 - a) Anti-inflammatory medications
 - b) Epidural steroid injections
 - Magnetic resonance imaging (MRI) of the spine.
 - d) Plain radiographs of the lumbar spine
- A 33-year-old man presents with a sudden onset of back and left leg pain and weakness after performing heavy squats at the gym. Radiographs are normal, but a MRI reveals a posterolateral left L5-S1 I erniated disc. What would a careful neurologic examination likely reveal?
 - a) Foot plantar flexion weakness with absent Achilles reflex.
 - b) Great toe extension weakness with absent Achilles reflex
 - c) Great toe extension weakness with absent patella reflex
 - d) Quadriceps extension weakness with absent patella reflex
- 42 A 71-year-old female presents with the sudden onset of severe lower back pain. Physical examination reveals severe kyphosis, while an x-ray of her back reveals a compression fracture of a vertebral body in the lumbar area along with marked thinning of the bones. Serum calcium, phosphorus, alkaline phosphatase, and parathyroid hormone levels are within normal limits. This woman's bone changes are likely due to?
 - a) Osteopetrosis
 - b) Osteoporosis
 - c) Osteomalacia
 - d) Osteitisfibrosacystica
- 43 A 56-year-old man is thrown violently against the steering wheel of his truck during a motor vehicle crush. On arrival in the emergency department he is diaphoretic and complains of chest pain. His blood pressure is 60/40 and his respiratory rate is 40 per minute. Which of the following would best differentiate cardiac tamponade from tension pneumothorax as the cause of his hypotension?
 - a) Pulse volume
 - b) Breath sounds
 - c) Pulse pressure
 - d) Jugular venous pressure

- 44 A patient is brought to the emergency department 20 minutes after a motor vehicular crash. He is conscious and there is no obvious external trauma. He arrives at the hospital intubated and conscious and there is no obvious external trauma. He arrives at the hospital intubated and completely immobilized on a long spine board. His blood pressure is 60/40 his pulse rate is 70. his pulse rate is 70 beats per minute. His skin is warm and he has no rectal tone. Which one of the following statements is true? a) Vasoactive medications have no role in early management. b) The hypotension should be managed with volume resuscitation alone. c) Flexion and extension views of the c-spine should be performed early. d) Flaccidity of the lower extremities and loss of deep tendon reflexes are expected. 45 Hermorrhage of 20% of the patient's blood volume is associated with? (a) Oliguria - 30-40 b) Confusion 30-40% ic) Hypotension - 30 -40 d) Tachycardia. 46 Which of the following is/are characteristics of hip osteoarthritis? a) Morning stiffness b) Pain at rest c) Antalgic gait d) Thoracic spine pain 47) A 45 year old lady has recently developed pain in the wrist especially late at night/early morning. She also experiences severe tingling sensation and sometimes her hand feel swollen. The one single examination you may want to do is: a) An X-ray of the wrist b) Doppler ultra sound of the hand c) A Hand CT-Scan d) A nerve conduction test across the respective wrist 48 Which of the following is the earliest laboratory finding in fat embolism: a) Increased serum lipase b) Increased serum fatty acids
 - 49 The Commonest cause of failure of internal fixation is:
 - a) Infection

2) Lipuria

- b) Metal reaction
- c) Immune deficient syndrome

d) Increased alkaline phosphatase.

- d) Stress fracture of implant
- 50 Death 3 days after pelvic fracture is most likely to be due to:
 - a) Hemorrhage
 - by Pulmonary embolism
 - c) Multiple organ failure.
 - d) Infection.

T Introshhol Bressine in comportment of localienous P Varlenoverous those perposion 51 A 7 year old boy with several weeks' history of a pain free swelling of the knee may have Chondrosarcoma b) Ewing's sarcoma Osteogenic sarcoma fibrous dysplasia-inadental radiologio findry ground gless appearance Pour, terdomer, swelly. 52 The Commonest complication encountered while using an external fixator is: a) Pin tract infection 1. pour, entreme, discherge b) Compartment syndrome c) Loosening of pins 3. Anhbohes 4. Radiologie d) Fixation of muscles 53 A patient who has sustained an open leg wound is bleeding profusely. Before the patient arrives in hospital, what is the safest method of stopping the bleeding: a) Pressure over femoral artery in groin. b) Direct pressure or the wound and elevation of the leg c) Ligation of bleeding vessel d) Use of tourniquet 54 Chemically Plaster of Par's is composed: a) Calcium phosphate b) Calcium sulphate c) Hemihydrated calcium sulphate. d) Anhydrous calcium sulphate ¥ 55 What is true of acute pyogenic osteomyelitis? a) Trauma is not a predisposing factor b) Infection is not blood borne c) Affects only the long bones d) May lead to chronic discharging sinuses 56 A patient develops compartment syndrome following manipulation and application of a cast for a Tibio-fibula fracture. What is the best treatment: a) Split the plaster b) Do operative decompression of facial compartments, c) Elevate the leg d) Infusion of low molecular weight dextran 57 Developmental dysplasia of the hip in the neonate is best detected by a) The hip abduction test b) X ray c) CF scan d) Ultrasonography

Control of the second	
	i de la semini
58 An example of non-inflan	nmatory arthropathy is the neuropathic kind as seen in:
36. An example of non-inflan	illiatory artinopassy
a) Gouty arthropathy	
b) Diabetic arthropathy	
c) Aseptic hip necrosis	
d) None of the above	
59. Inflammatory arthritis inc	Jude the following EXCEPT:
a) osteoarthritis of the kn	pa
details and the second	
b) systemic lupus erythen	natosus
c) rheumatoid arthritis	
d) ankylosing spondylitis	
60. Which of the following co	onditions is not associated with joint destruction?
a) pigmented villo-nodula	revnovitis
b) sickle cell disease	
CONTROL OF THE CONTRO	[- 선생님 - 선생
tuberculosis	
acute traumatic hemart	hrosis
61. Rheumatoid arthritis is	
a) caused by a sex linked	chromosome hence it affects women more
by Is a systemic disorder	
Single Park College Co	arthritis as they affect the joints similarly
d) Is the reason for a posi-	ive rneumatoid factor test
SPANA WATER OF THE	
62. A healthy looking 50-year-	old man presents with lytic lesions in his right humerus
a) The lesion is most like	y tuberculous in nature
	bserved and followed up by serial imaging before further
treatment	
The state of the s	sion for histological diagnosis should be done
d) the lesion is most likely	y a metastasis from the prostate gland
Carlotte Control of the Control of t	
63. Bone tumors are a challeng	ge as:
most tend to be very ag	gressive in nature and progression
b) Many remain symptom	less until late
	ctive therapy
d) most are metastatic in i	nature
64. The giant cell tumor is	
1 1 1 town on that do	es not metastases
a) A benigh tumor that do	and around the knee
b) is a malignant tumor fo	-1 to-ser
c) is typically an epiphyse	cal tumor
d) Is treated by amputatio	n of the limb involved
65 A 12-year-old presents wit	h mushroom like growths on both distal femora that are clearly
05. A 12-year-old prosents with	e nainless
outlined on radiographs and ar	o painted.
a) the boy should have an	urgent CT scan of the growths
by an avaigion higher of t	he growths should be carried out
c) The lesions are osteoge	enic sarcoma and the family should be counseled accordingly
c) The lesions are osteoge	e instituted as soon as possible
d) chemotherapy should be	o materior to both to position
	Page 12 of 18

66. Which of the followings statement regarding Hirschprung's disease are true? Nho so a) Suction rectal biopsy is always diagnostic if the specimen includes submucosa b) Hirschprung's disease is the result of a sex linked dominant gene XWX SEX LINKER c) The endorectal pullthrough is demonstrably superior to other forms of surgical d) 35 percent or less of patients have an excellent or good functional result following The important cause of mortality in contemporary practice is enterocolitis 67. Which of the following inhalation anesthetics accumulates in air-filled cavities during a) Diethyl ether Nitrous oxide c) Halothane d) Methoxyflurane e) Trichloroethylene 68. Which of the following statements about head injury and concomitant hyponatremia are There are no primary alterations in cardiovascular signs. b) Signs of increased intracranial pressure may be masked by the hyponatremia. c) Oliguric renal failure is an unlikely complication. d) Rapid correction of the hyponatremia may prevent central pontine injury. e) This patient is best treated by restriction of water intake. conted hypnati 69. A newborn full-term baby boy with diagnosis of imperforate anus is also at risk to have a a) Dextrocardia b) Rib cage anomaly C) Tracheoesophageal fistula d) Ulnar skeletal deformity e) Proximal limb malformation 70. Neonates with NEC may demonstrate all of the following findings on abdominal films except: Dilated bowd Local a) Prieumatosis intestinalis. BOWG Edong b) Portal vein air. Maglos sign c) Pneumoperitoneum. Colovesical fistula. e) Fixed and thickened bowel loops. 71. The following are true regarding testicular torsion; except (a) The highest incidence is in the neonatal and peripubertal periods (b) May present with abdorninal pain and vomiting and few testicular symptoms (c) Radiological investigation with doppler ultrasound or isotope scanning is invariably indicated (d) Testicular viability is reduced if surgery is delayed more than 6 hours V (e) Contralateral orchidopexy should also be performed if a torsion is confirmed

(a) Usually presents between 6 and 12 months of age 7 3 - 6 wes 72. Regarding infantile hypertrophic pyloric stenosis (b) The female: male ratio is 4:1 Has a strong familial predisposition Circular (d) Pathologically shows hypertrophy of the longitudinal muscle layer of the pylorus (e) Presents with bile-stained projectile vomiting 73. Scar formation is part of the normal healing process following injury. Which of the following tissues has the ability to heal without scar formation? a) Liver b) Skin c) Bone - codius d) Muscle - confragury None of the above .74. Which of the following statements are true in regard to electrical burns? a) High-tension electrical burn injury is most likely to be found in accidents in the home. Underlying heart muscle damage is likely in low-tension injuries. Large amounts of damage to subcutaneous tissues and muscle are associated with high-tension electrical burns. c) Myoglobinuria is a serious complication of low-tension burns. d) Severe alkalosis is common in large electrical burns. e) Underlying heart muscle damage is likely in low-tension injuries X 75. Which of the following statements regarding management of the acute wound are incorrect? a) A bleeding wound should be elevated and a pressure pad applied Clamps may sometimes need to be put on bleeding vessels blindly c) Anaesthesia is usually required in the assessment of wounds d) A thorough debridement is essential e) Repair of all damaged structures may be attempted in a tidy wound Use the options below to answer questions 76-80. Match the conditions (A-E) with the correct statement below. a) Acute appendicitis b) Ruptured ectopic pregnancy c) Ureteric colic d) Perforated peptic ulcer e) Acute Cholecystitis 76. A 25 year old female with severe lower abdominal pain. Markedly pale, cold and clammy extremities and is feeling faint. Not sure of her last menstrual period. B' 77. A 35year old with tenderness at McBurney's point. Also has pyrexia of 38 degrees, has vomited a few times and is anorexic. 78. A 40 year old male with right iliac fossa pain for 2 days preceded by severe epigastric

is pyrexial and very tender and rigid over the right iliac fossa. A

and right upper quadrant pain, Pain subsided with antacids but recurred. On examination

- 79. A 28 year old male with sudden onset severe right sided abdominal pain which he is unable to localise. He is writhing around and cannot find a comfortable position in which to get relief. On examination he is tender all over the right side of his abdomen with some rigidity but no rebound tenderness. C
- 80. A forty year old female complains of severe right upper quadrant abdominal pain following a fatty meal. She has had bouts of vomiting and pyrexia. On examination she has tenderness of the right upper quadrant associated with rebound tenderness.
- 81. On examination of a patient with acute pancreatitis the periumbilical discolouration noted on abdominal examination is known as:

Cullen's sign

b) Romberg's sign

c) Rovsing's sign

d) Grey-Turner's sign - Flanks.

e) Obturator sign - spasms of obturation internes pain on interne rotation of Hokal hip.

82. A woman aged 76 years presents with a painful swelling in the right groin measuring 4cm in diameter. It lies below the inguinal ligament and medial to the femoral artery. A plain X-ray of the abdomen reveals dilated small bowel loops. What is the most appropriate diagnosis?

a) Direct inguinal hernia

Femoral hernia

- c) Indirect inguinal hernia
- d) Intussusception
- e) Volvulus
- 83. Charcot's triad consists of
 - a) Fever, nausea and vomiting
 - b) Pain, nausea and jaundice

Pain, jaundice and feve: montal objundation, hypoten -> Regnad pontad -> challengillics - 1800 e) Jaundice, fever and nausea

- 84. A 20 year old man is brought to the emergency unit after falling from a height. He is complaining of dyspnoea and his blood pressure is low at 70/50 mm Hg. Breath sounds are reduced on the left side and he has a tracheal deviation to the right. The best initial treatment would be:
 - a) Chest radiograph
 - b) Close observation
 - Needle decompression of the left chest
 - d) Computed tomography scan of the thorax
 - e) Emergency surgical exploration

- 85. Falsely high non-invasive blood pressure measurements are associated with all the following except:a) Relatively smaller cuffs b) Loosely applied cuff c) Extremity below the heart Even compression applied on arm Larger cuffs 86. Which of the following lesions will require colostomy as an emergency lifesaving procedure?
 - Imperforate anus in males
 - b) Perineal fistula in both sexes
 - c) Rectovestibular fistula
 - d) Recto-urethral fistula.
 - e) Persistent cloaca
- 87. Painless frank haematuria
- Indicates cancer of the urinary tract until proven otherwise
- b) Is usually caused by kidney stones
- c) Is often caused by ranitidine treatment
- d) A computerized tomography (CT) of the abdomen is first line investigation
- e) Usually indicates mild urinary tract infection
- 88. Breast cancer

Parkiticization of the second

- a) Commences most frequently in the nipple
- b) Peaud'orange is a sign of early disease.
- c) Pain is an early sign
- All patients should have a tissue-diagnosis prior to definitive surgery
- e) Treatment does not depend on axillary node status
- 89. The following investigations are appropriate prior to surgery
 - a) An ECG in all patients older than 30 years
 - by Coagulation screen for all patients with obstructive jaundice
 - c) HIV screening for patients with acute appendicitis
 - d) Chest X-ray for all patients over 40 years
 - e) Liver function test for patients with acute appendicitis
- 90. Regarding preoperative evaluation
 - a) There is no role for history and physical examination \
 - b) Chest x ray is useful in all circumstances X
 - c) Usefulness of hemogram is to avoid blood loss
 - Post operative complications are a consideration
 - e) Cormorbidities are an occasional consideration

91. A 16 year old lady presents with a 3 month history of palpitations and anxiety. She prefers cold to warm environments. She has lost about 5 kilos in 3 months and experiences mood swings. Which statement is true? a) She most likely has anxiety-neurosis Thyroid antibodies assay is likely to be positive (Grands da)

C) Radioiodine is the preferred treatment option

d) B-adrenergic blockers are contraindicated

13 4 - 154 e) Elevated TSH is expected (() 92. A 2.8-kg. neonate with excessive salivation develops respiratory distress. Attempts to pass an orogastric catheter fail because the catheter coils in the back of the throat. A chest film is obtained and shows right upper lobe atelectasis and a gasless abdomen. The most likely diagnosis is: a) Proximal esophageal atresia without a fistula. b) Proximal esophageal atresia with a distal tracheoesophageal (TE) fistula. c) "H-type" TE fistula. d) Esophageal atresia with both proximal and distal TE fistula. e) Congenital esophageal stricture 93. Proper management of a head injured patient with a GCS of 9 include all of the following EXCEPT: a) Preventing hypoxia b) Preventing hypotensica c) Giving oxygen d) Preventing hypoglycaemia Use of steroids 94. All of the following factors influence healing of a wound except? Vascular insufficiency / Diabetes insipidus Malnutrition / d) Site of wound e) Smoking. 95. All of the following statements about hydrocephalus are true EXCEPT? It is not found in adults. It may present with a 6th nerve palsy. b) c) It may present with sunsetting eyes and a bulging fontanelle in infants. d) It can cause head enlargement in infants. It can cause papilloedema 96. Common causes of bowel anastomotic breakdown include all of the following except: a) Poor blood supply to the bowel edges Gross intraperitoneal contamination b) Inadequate bowel mobilization Hand-sewn anastomosis Poor technique

97. With uncomplicated para pneumonic pleural effusions, the pleural fluid usually has a:

- a) pH lower than 7.20
- b) low glucose level
- c) lactate dehydrogenase (LDH) level more than 3 times the upper limit of normal.
- d) negative gram stain for bacteria
- e) high white cell count

- a) cigarette smoking
- b) hypertension.
- c) hypercholesterolemia.
- d) diabetes mellitus
- exercise

99. A 78 year old diabetic male resident of an old peoples' home is brought to A&E with a two weeks history of episodes of somnolence and confusion. He is reported to have fallen in the bathroom and hit his head two months ago. The most likely diagnosis is

- a) Alzheimer's disease
- b) Acute subdural haematoma
- Chronic subdural haematoma
- d) Viral encephalitis
- e) Epidural haematoma

100. Surgical treatment for peptic ulcers is not indicated in:

- a) Intractable ulcers
- b) Bleeding that is not controlled by medical therapy or endoscopy
- c) Perforation
- d) Gastric outlet obstruction

For prophylaxis against developing malignancy
